

**Year 3**

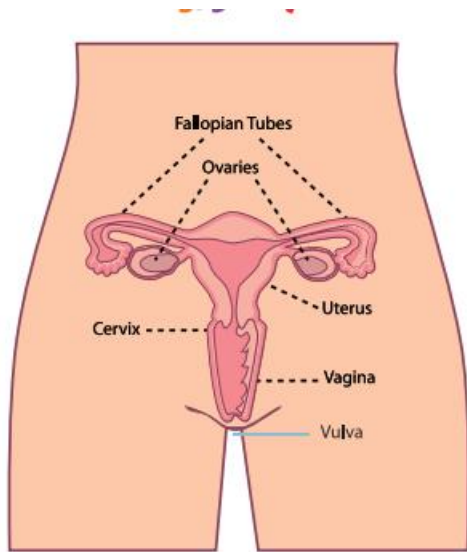

**Year 4**

A girl reaches puberty usually between the ages of 10 and 14, though it can be earlier or later than this. At this time she starts to produce one egg every month from her ovaries.

Many thousands of eggs are stored in the ovaries. A woman will release one each month for most of her adult life. Most will not be fertilised, so they pass down the tube into the womb and out of the body through the vagina.

However, every month the womb has to get ready in case the egg is fertilised. It makes a thick, soft, spongy lining with an extra supply of blood to provide the food and oxygen that a baby would need.

If the egg is not fertilised the extra lining isn't needed so it breaks up. For a few days the womb lining and the spare blood it contained will come out of the body through the vagina. This is what is called 'having a period'.

**Year 5**

A girl reaches puberty usually between the ages of 10 and 14, though it can be earlier or later than this. At this time she starts to produce one egg every month from her ovaries.
